

## **Introducing Interwise - The Leading eLearning Solution**

### **Introduction**

The Interwise ECP elearning platform has set the standard for excellence in the eLearning sector since the company was founded in 1994. The Interwise ECP platform is the first and only platform to deliver six distinct modes of interactive communication, collaboration and learning. These modes provide the flexibility to provide classroom lectures of ten to hundreds or even thousands. The platform connects students and teachers regardless of location or internet connection.

### **iClass: Interactive and Real-time Learning**

The iClass mode facilitates the same level of knowledge and skills transfer that normally takes place in the traditional classroom environment. The feature-rich Moderator Application uses an intuitive interface to both create and deliver highly interactive materials for an engaging learning experience. For example, a teacher can split up a class into groups and can look “over the shoulder” of individual students to provide assistance. The iClass mode delivers real-time group interaction with the ability to assess individual student status by using: Yes/No polling, text messages, tests, quizzes and assessments. A full complement of whiteboard tools, anonymous feedback and surveys are just a few of the online delivery tools. Application Sharing is another useful function that allows teachers to show and update any document or application on their own pc, to the entire class.

### **Scalable, Manageable, Recordable**

The Interwise system is scalable and will support hundreds to thousands of students by simply adding servers without disruption. The platform is managed from a central web portal and is accessed by students, professors and administration staff to manage the entire platform and contents. Students and teachers can record each class locally to their own pc, or on the server for latter review by students who missed the “live” class. From class recordings and assignments to teacher schedules and IT functions, the “Communication Center” provides a single point of entry and centralized management.

### **Material Creation and Management**

The Interwise provides a simple to use graphical editor to build and create multimedia presentations that are both interactive and engaging for optimal online learning. Teachers will also appreciate the syllabus, course management, attendance reporting, and test recording functions that facilitate the overall administration of even the most demanding of curriculums.

### **Conclusion**

Today’s education environment demands both flexibility and ubiquity while ensuring the business success of the learning institution. The Interwise ECP Platform is the leading elearning application that provides real time video, audio and multimedia application content all delivered over any standard internet connection, from dial up to broadband. Teaching and learning can now expand without boundaries or limitations and provide today’s students with the education they’ll need tomorrow.
